

HAPPY FROG ALL-PURPOSE® FAQs

Can I burn plants with Happy Frog® organic fertilizers?

There's very little risk of burning plants with our organic fertilizers. In fact, at twice the recommended dosage, plants will not burn. However, we do suggest that you follow package directions for best results. More fertilizer will not necessarily make a plant bloom earlier or grow faster! Many other factors, including weather, sunlight, water, drainage, and the quality of your soil, will impact growth and flowering times.

How often should I fertilize with Happy Frog®?

Most garden plants do best with a monthly feeding schedule that includes some time off during the dormant season. However, each plant is different, so be sure to follow package directions. How many cups are in a Happy Frog® package so that I can figure out how many packages I need? On average, there are 11 cups of fertilizer in each of the four-pound and Happy Frog® packages. This measurement varies slightly from product to product, because each Happy Frog® variety has a slightly different volume. Some of our Happy Frog® products also come in convenient 18-pound bags for large gardens and landscapes. On average, there are 49 cups in these 18-pound packages.

Should I be concerned if I notice fungi or mold growing on top of my soil after I apply Happy Frog® fertilizers?

Not at all. This is a normal condition. In fact, the fungi and mold are exactly what Happy Frog® fertilizers should be creating. These are beneficial bacteria which help deliver nutrients to your plants. However, you can reduce the appearance of surface mold by mixing Happy Frog® thoroughly into the top few inches of soil surface and water thoroughly.
